

The fully developed digital signage solution from inSynergie enables the easy generation of individual screen presentations. The central software iSVisionCreator meets all creative requirements as layouts are freely designable. In addition to the layout editor a separate text editor is integrated. The screen areas are filled via timeline with drag-and-drop.

Content such as animated and static backgrounds is already included in the Creator software, hence professional presentations result using simplest resources.

Due to the vector-based integration of the content, any image resolution is achievable. Texts, pictures, videos etc. can be supported with preset real-time effects. When new effects are available, they are easily integrated in the Creator software. A preview function allows the exact control of the played content. The iSVisionPlayer loads the presentations and contents at the predefined interval from an FTP server and displays them on the target system. Due to the simple connection to the FTP server, no extra costs for a data bank server or the like arise. The Creator may be installed as often as needed. Therefore it is possible for various sides, e.g. creative agency and IT department, to influence the content.

## inSynergie components:

- Vesa Mountable Digital Signage Player
- High Performance Digital Signage Player
- iSVisionCreator Software

## additional components:

- LCD-Screens
- speakers
